// Day 25 of 30

8 HABITS

What Senior Devs Do Differently in Code Reviews

→ Swipe through all 6 slides

They Read the PR Description First

Context before code

```
Junior: Jumps straight to code

Senior: Reads WHY first
  → What problem does this solve?
  → What was the approach?
  → What alternatives were considered?

Without context, you're reviewing
syntax, not solutions.
```

💡 Always write PR descriptions. Always read them.

They Check the Tests First

Tests tell the story

```
Senior reviewer's first click:
  → test files

Why?
  → Tests show WHAT the code should do
  → Edge cases reveal thinking depth
  → No tests? That's the first comment.

'The tests are the documentation
 that never goes stale.'
```

💡 No tests = incomplete PR. Always.

Slide 03

They Ask Questions, Not Commands

Coaching > criticizing

```
Junior reviewer:
  'This is wrong. Use HashMap.'

Senior reviewer:
  'What was the reason for choosing
   TreeMap here? HashMap might be
   faster for this use case — curious
   about your thinking.'

→ Same feedback
→ Completely different impact
```

💡 Questions teach. Commands frustrate.

They Look for Missing Code

What's NOT there matters more

```
Senior checks for:
  → Error handling missing?
  → Input validation skipped?
  → Edge case not covered?
  → Logging absent?
  → Index not created for new query?

Junior checks for:
  → Variable naming
  → Formatting
  → Style issues
```

💡 Missing code causes production bugs. Style doesn't.

They Think About Production

Will this survive real traffic?

```
Questions seniors ask:
  → What happens at 1000 req/sec?
  → What if the DB is slow?
  → What if this service is down?
  → Is this query N+1?
  → Will this lock the table?
  → What's the rollback plan?
```

💡 Code that works ≠ code that survives production

They Approve With Trust

Perfectionism kills velocity

```
Junior reviewer: 15 nit comments
  → Blocks PR for 3 days
  → Team velocity drops

Senior reviewer:
  → 2-3 meaningful comments
  → 'Approve with suggestions'
  → Trusts author to iterate

Ship > Perfect
(for non-critical code)
```

💡 Block only for: bugs, security, architecture. Rest = suggest.
